

The three categories of failures

Process deviations, human error and security violations: how to recognize and prevent them.

What ZOEF watches

The framework monitors and mitigates **three large categories of failures**.

1. Process deviations

- Not following the flows and guidelines previously agreed with the client.
- *Illustrative example:* closing a ticket without the user confirmation that the procedure requires.

2. Human error

- Inadvertent mistakes made by professionals during the operation. They are not intentional.
- *Illustrative example:* assigning a ticket to the wrong resolver group because of a typo.

3. Security violations

- Failures that affect the **confidentiality, integrity or availability** of data.
- *Illustrative example:* sending a user's personal data to a recipient who is not authorized.

Everyday prevention

- Follow the current procedure, even for routine cases.
- Review before sending or closing.
- Validate the user's identity before sharing any data.
- Report near misses: they show where the next error could happen.

Key points

- Three categories: process deviations, human error, security violations.
- Human error is inadvertent, not intentional.
- Security violations affect confidentiality, integrity or availability.
